

ABSTRACT

A multifunction massage system may be used to massage the neck and/or the back of a
5 user. The system is placed between the user and the back of a chair with the user leaning back
against the system to obtain a massage. The system includes a pair of counter rotating neck
massage heads the position of which can be adjusted to suit the height of the user. The system
also includes at least one pair of counter rotating back massage heads which massage the back
of the user. The speed and direction of rotation of the neck and back massage heads may be
10 selectively changed. Additionally the neck and back massage heads may be selectively caused
to vibrate in one of a plurality of vibrational modes and with a high or low force.
